White County Corn Plot

Planted April 25

Harvested September 25

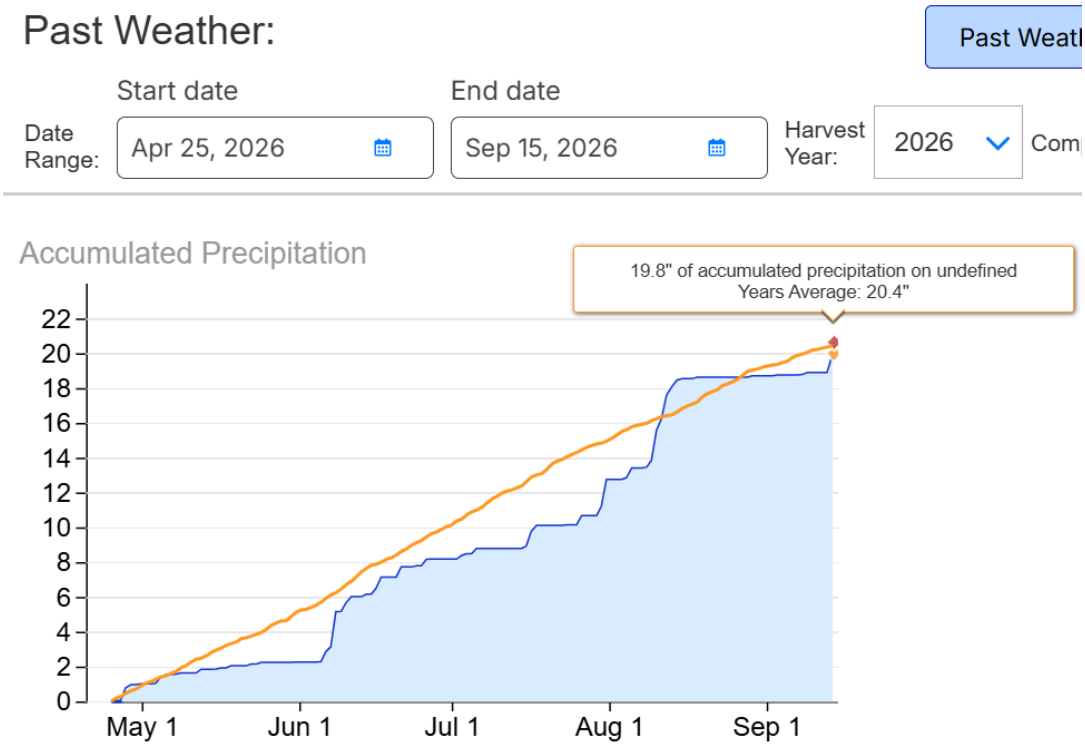

Rainfall 19.8 inches vs. 20.4 inches but had large saturating June and August rains

Severe winds occurred with the August storms and caused root tipping and lodging that limited grain fill and harvestability. Lots of corn was left on the ground.

There were 28 entries in this plot including 210-71 three times as the check. We only shelled 19 entries as the June storms caused water damage on the early end of the plot.

Yields followed standability. The yield ranged from 94.5 bpa to 222.1 bpa with an average of 182 bpa. The top 5 hybrids were:

210-71TRE	222.1
Preceon PR113-60	221.3
212-63VT4P	220.6
210-71TRE	213.0
Preceon PR110-60	209.0

You can see the 4 Preceon entries on the right side of the picture.
